## Intrahepatic Subcapsular Hematoma: A Rare But Life-threatening Complication After Laparoscopic Cholecystectomy

**Wai Yin CHU\***, Ning FAN, Ka Wing LUI

*Department Of Surgery, Yan Chai Hospital, HONG KONG*

**Background** : Intrahepatic Subcapsular hematoma is a rare condition after laparoscopic cholecystectomy. Only a number of cases has been reported literature. However it is a potential life threatening condition. Management depends on clinical condition and presentation with multi-disciplinary approach.

**Methods** : Two cases of Intrahepatic subcapsular hematoma in early postoperative period after emergency laparoscopic cholecystectomy are reported.

**Results** : Two different approaches were adopted: one patient was treated conservatively while another one was managed with angiographic embolization and imaged-guided drainage.

**Conclusions** : Successful management of intrahepatic Subcapsular hematoma depends on early detection and timely intervention with multi-disciplinary approach.
